

## Disposable Yellow Jacket Trap

M362, M365 and M367

### Trap Baiting Instructions:

***Note: Assemble the trap inside and wash hands before going outside to hang the trap. The attractant is very powerful. Yellow jackets can sting and cause allergic reactions in some people.***

1. Open trap.
2. Remove bait packet.
3. Open and empty bait into the jar.
4. Add 2/3 cup of water to bait or add water to Fill Line.
5. Swirl water and bait together.
6. Hang trap (See **Trap Placement**).

**Note:** As trap fills, add water to keep yellow jackets submerged.

### Trap Placement:

Place the trap away from human activity. If trap will be used during a BBQ or other activity where food is present, place traps out at least an hour before food is brought outside.

In the spring, hang trap where it will get late morning and early afternoon sun or evening sun. In the middle of summer, place the trap where it will get mid-morning or evening sun.

### Discarding the Trap:

During peak yellow jacket season (July through mid-September), you will be able to tell if the trap is full if yellow jackets enter holes and leave again. This means that the trap surface is entirely covered with insects.

In the early part of the season (spring) and later (fall), you may want to check the trap by carefully opening the top and looking inside the trap to determine if the trap is full. If

you choose to check the trap, do so in the very early morning or in the evening when yellow jackets are less active. Once the trap is full, discard in your normal trash collection.

### Other

The attractant will last about a week during normal temperatures. Extremely hot weather will cause the attractant to evaporate quicker. The trap is not intended to be reused; however, if the surface of the inner board is still sticky and not full with insects, you may re-bait the trap with Safer® Brand Yellow Jacket Attractant available from your retailer. Re-bait inside and follow the precautions outlined above.
